

## Quick Reference Guide

### .050 CENTERLINE MICRO-MATCH CONNECTOR SERIES

The TE Connectivity (TE) Micro-MaTch connector family, with its contact spacing of 1.27mm, offers a variety of wire-to-board and board-to-board interconnections. The Micro-MaTch contact helps prevent fretting corrosion, the traditional failure mode in tin-plated connections. Relative movements caused by vibrations/thermal expansion between male and female contacts are absorbed by an additional positioning spring in the female part. By preventing movements on the contact spot, a gas tight connection can make the Micro-MaTch contact spring system fretting corrosion resistant.

#### Features and Benefits

- Wire connectors supplied on-tape and suitable for mass termination of 28 AWG [0.08 mm<sup>2</sup> to 0.09 mm<sup>2</sup>] ribbon cable
- Tin plated contact design
- Gas tight connections
- Fretting corrosion resistant
- Full range of application tooling from hand tool to fully automated equipment
- Wire to Board, and Board to Board Interconnection system

#### Product Applications

- Car Radios
- Navigation Systems
- Dashboard Systems
- Base Stations
- Phones
- Set Top Boxes
- Audio equipment

# HOW MICRO-MATCH CONNECTORS WORK

The Micro-MaTch connector design helps prevent fretting corrosion which is the traditional failure mode in tin plated connections. Due to an additional positioning spring in the female part, relative movements caused by vibrations and thermal expansion between male and female contacts are absorbed. By preventing movements on the contact spot, a gas tight connection is made. This contact spring system featuring the positioning spring, compensates positional tolerances and provides the high contact force required for tin plated contact systems. The Micro-MaTch contact spring system is fretting corrosion resistant.

**Micro Sample Kit** with 3 samples incl. cable assembly: **4-1773465-8** (available via Media Resource Center)

# FREQUENTLY ASKED QUESTIONS

Can we make Micro-MaTch connectors with contacts in Gold plating?

No. The Micro-MaTch receptacle contact spring is designed to deliver a high normal-force as required for tinplated contact interconnections. This pressure is too high for gold plated interconnections, where much lower normal-forces are required.

We have noticed that the kinks of the Micro-MaTch thru-hole solder contacts on Top Entry as well as Side Entry Thru-hole solder Connectors, start with random direction. Is this technically OK?

Yes, this is OK and does not affect contact retention. For those connectors the kink direction in each row can start random, but sequential contacts within each row have kinks pointing in opposite directions.

Which flat ribbon cable is suitable for Micro-MaTch male-on-wire and paddle-board connectors and why?

TE Connectivity (TE) part number 167019-series Flat Ribbon Cable. The cable insulation's round shape at each position

and the flat transition between the positions, both exactly match with corresponding shape in the cover. This enables accurate pre-positioning of the conductors regarding to the IDC-slots during the termination process. It is also Important that the conductor's pitch is within tolerance and that they are symmetrically positioned in the round insulation shape.

Are Micro-MaTch male-on-wire and paddle-board connectors also suitable for discrete wire termination?

No. For discrete wires, Micro-MaTch connectors offer the Crimp-On Snap-In (COSI) connectors in 2 wire ranges.

Is there retention force performance information available for the female connector versions with locking latches?

No. The plastic latches were not designed to retain the connectors but to produce an audible click when the connectors are fully mated.
